

## **Complex Signature IDS**

Correlating System and Application Logs with Traffic Traces and IDS Alerts

Mike Poor mike@digitalguardian.net

# The Dilemma

- Network 'Attack' Detection Systems PROS:
  - very complex
  - "good" at detecting attacks
  - real time performance and speed
  - CONS
  - Systems will not indicate whether attack was successful or not
  - Overwhelming amounts of alerts

## Objectives

- iptables log analysis
- ♦ tcpdump audit trail
- Microsoft Event Viewer
- Web server log data
- Snort alert processing
- Syslog signatures
- Correlation of data

May 26 11:42:17 bello kernel: FW-DROP-DEFAULT IN=eth0 OUT= MAC=00:07:95:ad:53:2e:00:00:c5:79:60:5c:08:00 SRC=211.186.120.193 DST=192.168.1.7 LEN=48 TOS=0x00 PREC=0x00 TTL=111 ID=37130 DF PROTO=TCP SPT=3230 DPT=1433 WINDOW=16384 RES=0x00 SYN URGP=0 May 26 11:42:17 bello kernel: FW-DROP-DEFAULT IN=eth0 OUT= MAC=00:07:95:ad:53:2e:00:00:c5:79:60:5c:08:00 SRC=211.186.120.193 DST=192.168.1.4 LEN=48 TOS=0x00 PREC=0x00 TTL=111 ID=37131 DF PROTO=TCP SPT=3227 DPT=1433 WINDOW=16384 RES=0x00 SYN URGP=0 May 26 11:42:17 bello kernel: FW-DROP-DEFAULT IN=eth0 OUT= MAC=00:07:95:ad:53:2e:00:00:c5:79:60:5c:08:00 SRC=211.186.120.193 DST=192.168.1.10 LEN=48 TOS=0x00 PREC=0x00 TTL=112 ID=37134 DF PROTO=TCP SPT=3233 DPT=1433 WINDOW=16384 RES=0x00 SYN URGP=0

Check the initial Handlers Diary at Incidents.org

(http://www.incidents.org/diary/diary.php?id=156) for more information on traffic spikes relating to the SQL-Snake worm. This particular worm exploited machines running MS-SQL Server which have 'SA' accounts with no password.

The common reactions to scans run the gamut from "its just a scan... why should I worry about a scan" to "lets automatically block any ip that scans us". Both are naïve, and in my opinion wrong. Blocking offending hosts based on analysis of inappropriate network activity is perfectly acceptable, but auto-blocking sets one up for a serious DOS attack. Not paying attention to scans will cost you dearly in lost information gathering on your enemy at the gate.

We can learn many things from scanning activity. If the scan is for a specific service, we can make the assumption that the attacker has an exploit for that service, or that he/she is looking for a backdoor into your systems. If they are scanning for a specific service that is only found on one operating system, the attackers probably have a method of compromising that O.S.

What we have done here is read in a binary (pcap format) format log file named logfile.dmp looking for all machines that sent a SYN/ACK packet from a source port of 1433.

Now that we have a list of potentially compromised machines, the System Administrator can now don the hat of the Incident Handler and isolate those machines and assess the level of compromise. The next steps would certainly be to run forensic tools on the machines, gather recovery information from Cert, Security Focus, Incidents.org asd other security information sources.

A simple cursory knowledge of BPF filter creation can give an IDS analyst awesome power to extract and analyze events of interest on the network. In the case of the above filter:

#### 'tcp and src port 1433 and (tcp[13] = 17)'

we are looking for tcp packets, coming from a source port of 1433, that have a value of 3 in the  $13^{th}$  byte offset from zero of the tcp header. This field corresponds with the tcp flags field, and the two least significant bits are the SYN and the ACK, as shown below.

128 64 32 16 8 4 2 1 RES | RES | URG | ACK | PSH | RST | SYN | FIN

The main concerns when setting up a tcpdump audit trail is: how much data can/should we capture? We need to capture enough data to establish whether or not connections took place, and give us a general idea of what took place during that connection.

It is not necessary on the other hand to capture every byte of data in and out of your networks. Perhaps you have a web server farm that is well monitored by other technologies (NIDS, syslog logging facility, and webserver logs). You may wish to exclude TCP port 80 from your captures (this should eliminate your heaviest burden).

These numbers are subjective, your mileage may vary. The length of time that you keep logs in operational store (online) will vary according to the amount of data that you collect and the storage size allotted to your online log storage.

Binary tcpdump logs are compact and very versatile. Once saved they can be read by any libpcap aware application, which adds to its universal appeal.

Different tools can be used to export Microsoft Events to Syslog. Two of the most powerful and popular are NTEventlogger and NTsyslog. NTEventlogger is a commercial product, and NTsyslog is released under the GPL.

For a complete list of available projects, check http://www.loganalysis.org/sections/syslog/windows-to-syslog/index.html

9	First step: Enable Auditing						
1.12	Local Security Settings						
	Action View ← → 🗈 🖬 😼 😫						
ST.	Tree	Policy A	Local Setting	Effective Setting

The first step that must be done is to enable Security Auditing. This is turned off by default. Next you want to increase the maximum size of your Event logs, as the default is 512 bytes. This value must be set in 64 byte increments, but Windows will automagically resize them for you. The default setting is to overwrite events as needed. If you have your events exported to syslog, this is probably ok. Otherwise, you have two other choices, clear logs manually (which leaves you in the uncomfortable position of missing new events until you do), or to clear logs after X amount of days (same problem as above).

9	Event Reporter Client

	OK     Cancel     Apply					
	Connected to: LOCALHOST					

Two different ways to export your NT event logs to centralized syslog host. 1: Event Reporter (shown above). 2. NTsyslog (next slide).

Event reporter is a great tool, and very useful in the enterprise. It is full featured, supports numerous syslog/syslog-ng options, including different compatibility modes as well as sending messages to email.

Event reporter is commercial software, which costs \$50 per client, with bulk discounts.

Q	NTsyslog				
	🕴 NTSyslog Service Control Manager				
	Service status on computer <local machine=""></local>				
E	Service is running.				
	Select Computer Start Service Stap Service				
	Configuration Syslog Daemons Select Syslog Daemon servers for forwarded events. Use the drop down menu below to select which EventLog to forward.				
	Application <u>EventLog</u>				

NTsyslog is a free open source project, released under GNU General Public License (free as in free beer).

NTsyslog is a full featured service that exports NT/win2k events to a centralized syslog server. NTsyslog installs as a service on the Windows host, so no need for human interaction after setup is needed. The export format is fully compatible with syslog protocol.

## Windows Events

This is a simple grep through a random days worth of logs. We see that we are constantly being scanned, probed and prodded for vulnerable IIS web servers. The fact of the matter is, many of us do not know which hosts are running what on our network, much less what patch level they are at.

This shows a packet capture from Snort IDS, showing an attempt to pass parameters to the windows command shell.

Everyone involved in network and computer security should have the opportunity to do a sanity check on a web server and run two simple greps:

grep 'cmd.exe' <filename> grep '/etc/passwd' <filename>

From an Apache web server running on Linux (not vulnerable):

X.X.X.X - - [30/Jan/2003:14:55:17 -0500] "GET /scripts/..%c0%2f../winnt/system32/cmd.exe?/c+dir HTTP/1.0" 404 -X.X.X.X - - [30/Jan/2003:14:55:18 -0500] "GET /scripts/..%c0%af../winnt/system32/cmd.exe?/c+dir HTTP/1.0" 404 -X.X.X.X - - [30/Jan/2003:14:55:18 -0500] "GET /scripts/..%c1%9c../winnt/system32/cmd.exe?/c+dir HTTP/1.0" 404 -

From a vuln windows webserver, first we see an attempt that didn't work, and then one that did:

14:45:45 X.X.X.X GET /scripts../../../winnt/system32/cmd.exe 404 14:46:21 X.X.X GET /scripts/../../winnt/system32/cmd.exe 200

14:26:18 192.168.1.100 GET /scripts/.Á ../winnt/system32/cmd.exe 500

>> 500 Internal Server Error "The Server encountered an unexpected condition which prevented it from fullfilling the request.

14:28:57 192.168.1.100 GET /.Á/scripts/.Á ../winnt/system32/cmd.exe 404 >> 404 not found "The server has not found anything matching the Request – URI.

15:06:00 192.168.1.101 GET /scripts/../../.winnt/system32/cmd.exe 200 >> 200 OK. "The request has succeeded. The information returned with the response is dependent on the method used in the request."

15:06:41 192.168.1.101 GET /scripts/../../../winnt/system32/cmd.exe 200

See http://www.w3.org/Protocols/rfc2616-sec10.html or view the rfc directly at ftp://ftp.rfc-editor.org/in-notes/rfc2616.txt

Nmap is a great tool for auditing your network. Before going down this road, I must caution you however to the dangers of network scanning. Plenty of people have broken networks, caused network outages and disruptions, and lost their jobs or faced prosecution due to unauthorized network mapping. GET PERMISSION IN WRITING.

That said, I find that using nmap to create a known baseline for your listening services on known hosts, then monitoring your network against this baseline (using tools like ndiff) can be of great service in detecting intrusions.

Ndiff is written and maintained by James Levine (jdl@vinecorp.com).

From www.vinecorp.com/ndiff/:

Ndiff compares two nmap scans and outputs the differences.

Ndiff can easily be run as a cron job (see man pages for ndiff and nrun that comes with the package) to automatically run nmap and ndiff, and log the differences from the baseline.

Now that we have confirmed that the attack matches a known pattern for an attack against a wu-ftdp server, versions 2.6.1 and below, we must now determine whether or not the attack was successful or not.

We know go to our central syslog server and pull the logs relating to that ftp server.

As you can see, we start with an anonymous ftp login from 192.168.1.40, no application crash, then he adds two users, one normal and one root. An hour later, we see the user return and login as root via ssh. Sign of Compromise? Now we know for sure.

Once we apply patches to the wu-ftpd server, the exploit is tried again, and it does not work

We've seen in this presentation how we can correlate basic information from existing system and application logs to further investigate and analyze the events that come across our ids.

Thanks to the work of Tina Bird, Marcus Ranum and many others, we are slowly building up a database of system and application signatures and the tools to find them.

I highly recommend Tina and Marcus' website http://www.loganalysis.org as well as Tina's mailing list.
